

Project Overview

Project Scope

The Berkeley Park Improvements project began implementation of the park's master plan by reconfiguring the north lakeshore and creating a berm both to screen Interstate 70 from view and to soften highway noise. Following dewatering and construction of the berm, this area was restored to its natural appearance with the planting of trees and native grasses. Additional improvements included the following: enhanced walking trails comprised of new concrete flatwork and crusher fines paving; new lighting, benches and other amenities; a restored lake edge including a variety of aquatic plantings; fishing access, fishing habitat and stormwater quality improvements; a new irrigation system; and improvements to the irrigation pump inlet.
