

Project Overview

Project Scope

Renovation work at the Bear Valley Branch of the Denver Public Library comprised the following major elements: reconfiguration of interior spaces to enhance circulation; upgrades to electrical, fire protection, lighting, mechanical, and plumbing systems; installation of new energy-saving membrane roofing; restoration of hardwood on the second floor observation deck; updates to interior finishes including new carpet, paint and window coverings; upgrades to furniture and equipment; procurement and installation of self-check stations; as well as installation of a radio frequency identification (RFID) system. Together, the self-check and RFID technologies allow for automated self-check of library media and provide numerous benefits including improved circulation/collection management, reduced theft of library materials, increased efficiency of library staff, and an enhanced customer experience.
