Project Scope

Renovation work at the Bear Valley Branch of the Denver Public Library comprised the following major elements: reconfiguration of interior spaces to enhance circulation; upgrades to electrical, fire protection, lighting, mechanical, and plumbing systems; installation of new energy-saving membrane roofing; restoration of hardwood on the second floor observation deck; updates to interior finishes including new carpet, paint and window coverings; upgrades to furniture and equipment; procurement and installation of self-check stations; as well as installation of a radio frequency identification (RFID) system. Together, the self-check and RFID technologies allow for automated self-check of library media and provide numerous benefits including improved circulation/collection management, reduced theft of library materials, increased efficiency of library staff, and an enhanced customer experience.

Project Photos

1. Updated lobby and circulation desk
2. Updated computer stations
3. Grand re-opening board
4. Updated finishes and furnishings
5. Updated finishes and furnishings
