**Project Overview**

This work location includes installation of a new storm drain inlet on the Northwest corner of the T-intersection of 11th Ave and Wolff St. From this inlet, a new 18” storm pipe will run to the North through Dry Gulch Park. The new 18” pipe will tie into an existing inlet before discharging into Dry Gulch.

The purpose of the project is to correct a low point drainage problem at the intersection of W. 11th Ave. and Wolff St. The existing sidewalk chase drain and narrow vegetated swale are not functioning properly for stormwater conveyance. Under existing conditions, stormwater runoff collects in a curb and gutter sump at the North side of W. 11th Ave. Standing water, ice and odors have become a nuisance for the neighborhood.
